Contents

1 Installation

1.1 GNU Emacs

1.1.1 Linux

Use your package manager.
   Use Arch Linux. Dunaát make me say it twice.

1.1.2 Windows

Head on over to `https://www.gnu.org/savannah-checkouts/gnu/emacs/download.html` and download yourself a *fresh* copy of GNU Emacs.

1.2 My distribution

1.2.1 Linux

Backup your current `~/.emacs.d` with the following command:

```
mv ~/.emacs.d ~/.emacs.d.bkp
```

   Clone my configuration folder to your home directory:

```
cd ~
git clone https://github.com/Blendoit/.emacs.d.git
```

1.2.2 Windows

Download a `.zip` of the files in this repository. Then, extract the `.zip`, and rename the extracted folder to `.emacs.d`. Place this folder in your home folder (one level up from `Documents`, `Pictures` or `Desktop`).

2 Main Files

2.1 `init.el`

This is the first editable file that GNU Emacs loads on startup. This file's only purpose is to load my literate configuration `blendoit/init-blendoit.org`.

2.2 `init-custom.el`

All customization options available in Emacs' GUI that can be saved with `Options - Save Options` are saved here.
   This is useful to fool around with GUI customization options, without breaking our manually written code.

2.3 `blendoit/init-blendoit.org`

This is my personal literate configuration files.

3 Usage

Each configuration file is commented.
